* CONTINUATION ORDER PLAN
In order to facilitate the rapid delivery of important research information, a continuation order plan is available for volumes purchased in a series. The plan is of particular benefit to those readers who wish to remain thoroughly informed about the latest developments in their fields of research. Utilization of such a plan will ensure the delivery of each new volume in a series immediately upon publication and will eliminate a great deal of paper work on your part. When ordering, simply indicate the volume(s) you wish to receive and mark “and continued” on your order. Members of the plan are billed upon shipment of the book. This arrangement is solely for your convenience and may be cancelled by you at any time.

ANTENATAL DIAGNOSIS

Edited by Albert Dorfman

A symposium sponsored by the Mental Retardation Branch of the National Institute of Child Health and Human Development was held in 1970 to review the diagnosis and control of human genetic disease. Focusing on the diagnosis in utero of genetic diseases which lead to severe crippling and mental retardation, this volume explores the technique and risks of amniocentesis; the normal chemistry and physiology of amniotic fluid; the use of amniocentesis to detect chromosome abnormalities and genetic defects; the implications of amniocentesis for human population genetics, and the legal and ethical implications of this technique on the abortion of affected fetuses.

Genetics and American Society

Kenneth M. Ludmerer

The interaction between science and society is complex, often subtle, and sometimes indirect. In the first social history of genetics in the United States, Kenneth Ludmerer explores ways in which genetic theories were used—and sometimes misused—to justify various laws, and how political and social events in turn affected the development of genetic science. His book does much to elucidate the genetics-society interface.

MAN, MIND, AND HEREDITY

Selected Papers of Eliot Slater on Psychiatry and Genetics

Edited by James Shields and Irving I. Gottesman

"These papers have been nicely chosen. The meaty technical pieces on how manic depressive insanity or schizophrenia is inherited, or on the link between sexuality and neurosis... are seasoned with methodological ones like that on how to be certain whether or not twins are monozygotic."—The Times Literary Supplement

SOCIAL CONTROL AND SOCIAL CHANGE
Edited by Sarah F. Scott and John Paul Scott, Director of the Center for Research on Social Behavior, Bowling Green University
The authors present theoretical discussions of the various aspects of control processes—biological, political, psychological, social, and social psychological—as well as detailed research and practical applications of the new scientific perspectives of social control. Contributors include: John Paul Scott, Brian Sutton-Smith, B. G. Rosenberg, Arthur G. Neal, Gilbert Abcarian, and William B. Jackson.

INTRODUCTION TO THE STUDY OF ANIMAL POPULATIONS
Second Edition
H. G. Andrewartha, University of Adelaide
This study determines how environment determines an animal's chance to survive and reproduce. Theory is illustrated by ecological case histories, and there are a number of chapters on experimental techniques that are applicable both to laboratory and field populations. The author has updated his theory of environment for this new edition of a book first published in 1961.

THE ORIGINS OF THEORETICAL POPULATION GENETICS
William B. Provine, Cornell University
This work provides the first historical account of the development of population genetics from its beginnings in the work of Darwin through the laying of its modern theoretical foundations. In tracing the development of these theories, Mr. Provine conveys a real sense of the personal conflicts and human confrontations that occur in the process of scientific progress.

GENETICS AT WORK:
NEW APPROACHES TO OLD PROBLEMS

New 4th Edition!

Heritable Disorders of Connective Tissue

Dr. Victor A. McKusick is one of the most distinguished names in contemporary genetics. And since its 1st edition in 1956, his book, HERITABLE DISORDERS OF CONNECTIVE TISSUE, has been one of the most highly regarded volumes in the field of genetics. Described in its previous editions as a “landmark in the study of unusual syndromes” and as “the most valuable synthesis of information relating to generalized disorders of connective tissue whether heritable or not,” this classic reference is now available in a new, revised 4th edition.

In this new edition, Dr. McKusick and his collaborators have compiled the most complete data on their own research and the latest developments by others. A completely new chapter on the osseous skeleton is highlighted by a full report and evaluation of Dr. McKusick’s own current research on a highly heterogeneous category of skeletal dysplasias. An expanded discussion of mucopolysaccharidoses reflects the knowledge explosion that has occurred in this field. New color plates, as well as useful material on improved methods for management of Marfan’s syndrome, are just a few of the many highlights making this new 4th edition the most complete and up-to-date volume in its field.

By VICTOR A. McKUSICK, M.D., Professor of Medicine, The Johns Hopkins University School of Medicine; Physician, The Johns Hopkins Hospital, Baltimore. October, 1972. 4th edition, approx. 736 pages, 6¼” × 9¼”, 1,099 illustrations, including 2 color plates. About $29.50.

GENETICS AND COUNSELING IN MEDICAL PRACTICE. This practical book gives a precise, thorough explanation of common genetic abnormalities, their etiologies, and their consequences for the patient and his family. Techniques of counseling are stressed, with specific emphasis on the family physician as counselor. By Leonard E. Reisman, M.D.; and Adam P. Matheny, Jr., Ph.D. 1969. 215 pages plus FM I–XII, 6¾” × 9¾”, 86 illus. Price, $16.75.

BIOLOGY AND KNOWLEDGE
An Essay on the Relations between Organic Regulations and Cognitive Processes
Jean Piaget, University of Geneva
Synthesizing the research and investigations of a lifetime, the author discusses the nature of intelligence and of knowledge in the light of contemporary findings in biology. He contends that the loss or “bursting” of instinct in man has permitted an intellectual evolution, or “reconstruction with overtakings” of human knowledge. This work is one of the first to explain logical thought by returning to the necessary biological framework.

EVOLUTION AND THE GENETICS OF POPULATIONS
Sewall Wright
Volume 1: Genetic and Biometric Foundations
Professor Wright opens with a brief account of pre-Mendelian ideas, then takes up modes of inheritance, types of reproductive cycles, the nature of the gene, statistical methods, and other subjects. “A major event in evolutionary biology.”—American Scientist
1968 479 pages Cloth $15.00

Volume 2: The Theory of Gene Frequencies
This volume is concerned with such subjects as the relations of gene to zygote frequencies in various genetic systems, modes of change of gene frequencies, path analysis, and phenotypic variability. “A most impressive book, wherein a master of the subject of population genetics has stated without equivocation his opinions on the subject.”—Science

MAN'S ROLE IN CHANGING THE FACE OF THE EARTH
Edited by William L. Thomas, Jr.

With the Collaboration of Carl O. Sauer, Marston Bates, and Lewis Mumford

This pioneering work has a valuable contribution to make to current environmental research. Among the many topics it discusses are man's impact upon the seas and coastlines, changes in the quantities and qualities of ground and surface waters, the ecology of wastes, urban-industrial demands on the land, the possible limits of raw-material consumption, limitations on energy use, and technological denudation.

Man's Role in Changing the Face of the Earth is a sweeping history of human culture vis-a-vis the earth; it is a large-scale multidisciplinary evaluation of what has happened and is happening to the earth under man's impress.

"A work which is extraordinarily interesting and of the first order of importance for the welfare of all human beings." (Ashley Montagu. Natural History) Cloth edition (1956), $17.50.

Our mission is to advance human genetics in science, health, and society through excellence in research, education, and advocacy.

It will examine whether the tools of medically justifiable genetic modification of human subjects are appropriate for modification of human non-disease traits for what are called "genetic enhancement," and to indicate conclusion that a sport represents an area in that this development in human biology is likely to be first tested.
