Industrial concentration was traditionally summarized by the concentration ratio, which simply adds the market shares of an industry’s four, eight, twenty, or fifty largest companies. In 1982, when new federal merger guidelines were issued, the Herfindahl-Hirschman Index (HHI) became the standard measure of industrial concentration. Suppose that an industry contains ten firms that individually account for 25, 15, 12, 10, 8, 7, 5, 5, and 3 percent of total sales. Secondly, while industrial concentration is generally found to have a positive effect on R&D spending, its effect on innovative output is mostly found to be non-positive. This paper discusses the paradox between the effects of industrial concentration on R&D and on innovative outputs, and the possible different effects of concentration on small and large firm R&D on the basis of an empirical study of R&D spending in the Dutch manufacturing industry. 2. Empirical Study.
