I) Law

II) Experimentation and Ethics

### III) Histories of the Body

IV) Technology, Imaging, and Representation

Ethics guide. Experimenting on animals. Animal experiments are widely used to develop new medicines and to test the safety of other products. Many of these experiments cause pain to the animals involved or reduce their quality of life in other ways. If it is morally wrong to cause animals to suffer then experimenting on animals produces serious moral problems. Ethical Issues. In terms of ethics, the main issue in animal testing is simply that many experimental animals suffer in ways which are unnatural to them. Through the use of genetic manipulation, obese mice, diabetic mice, and mice with Huntingtonâ€™s disease can be created. Opponents of animal experimentation point to the obvious differences between humans and other animals as proof that animal research is not reliable.
